

Turn off and unplug electronics

Why? Some of your home's biggest energy users, like your refrigerator, need to stay plugged in 24/7. But other appliances and electronics can be unplugged or shut off during Peak Time Savings Hours to reduce energy use.

Tip Details

Step by step:

1. Identify other devices around your home that you can turn off and unplug for a few hours. For example, game consoles can use a lot of electricity—even when they're off.
2. Unplug these devices during Peak Time Savings Hours and give them some time to reboot afterwards.
